MEL-PLEX Mission

Our programme aspires to tackle melanoma by bringing together different research disciplines in an innovative Systems Medicine approach within a European Consortium.

About melanoma

Malignant melanoma is a cancer with one of the highest incidence growth in Europe and North America, responsible for more than 70% of all skin cancer-related deaths worldwide.

Classic clinical approaches for melanoma treatment are largely unsuccessful due to the complexity of the disease.

Achieve Scientific Excellence...

Novel treatment options for personalised melanoma therapies can now be explored through newly emerging and innovative research disciplines that go significantly beyond the current state-of-the-art.

Empower Young Scientists...

Programme Goals

The main goals of this training programme are:

- to train researchers that **can navigate confidently** between different research environments, and that have developed an **innovative and creative mindset** to transform research findings into applications;
- to create **tools and biomarker signatures** for personalizing and optimizing melanoma therapy.

Maximise Employability...
